Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUMMARIES

The present sequence represents a human preptin peptide. The peptide corresponds to Arg69-Leu102 of the proIGF-II E peptide. Preptin is secreted by pancreatic islet beta-cells which enhances glucose-mediated insulin secretion. Preptin peptides and their analogues are useful in preparing medicaments for preventing or treating a condition which results in or involves deficient insulin synthesis, secretion or action e.g. type II diabetes. Antibodies specific to preptin peptides are useful in an immunological assay such as radioimmunoassay (RIA), IRMA (undefined) or Enzyme linked immunoabsorbant assay (ELISA) for

New mammalian peptide with preptin functionality, useful for preventing or treating Type 2 diabetes mellitus by stimulating insulin secretion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        quantitatively measuring preptin in a biological fluid preferably in cerebrospinal fluid. Agonists or antagonists of preptin peptides are useful for modulating glucose mediated insulin secretion
                                                                                                   preptins (ADM35841-ADM35843), preptin analogues, preptin agonists salts or derivatives thereof. Preptins are able to stimulate the proliferation and differentiation of beta-cells and fibroblasts.
                                                                                                                                                                                                                                                         Use of preptins, preptin analogs, preptin agonists, their salts or derivatives, for treating a mediated disease, disorder or condition mediated in whole or in part by beta-cells or beta-cell dysfunction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 34
                                                                                                                                                    The invention relates to a method for treating a disorder mediated by panoreatic islet beta-cells or beta-cell dysfunction by administering
                                                                                                                                                                                                                                                                                                                                                                                                                                      01-AUG-2002; 2002NZ-00520536.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC insulin secretion, hyperglycaemia or post-prandial hyperglycaemia. They CC may also be used for treating and/or preventing peripheral nervous system CC injury; Alzheimer's disease; Parkinson's disease; stroke; amyotrophic CC lateral sclerosis; muscular dystrophy, diabetic neuropathy; cardiac CC disease and acute attack; and acute renal insufficiency caused by CC ischaemia. They are additionally useful for increasing or maintaining CC beta-cell mass or beta-cell number; for stimulating beta-cell cC colliness via cell differentiation or neogenesis; for increasing type CC death of motor neurons; for increasing muscular end plates; promoting the CC functional recovery of damaged sciatic nerves; preventing peripheral CC motor paralysis during or as a result of chemotherapy; and for improving CC myocardial function. The present sequence represents human preptin, which is specifically claimed for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

Specifically, it refers to increasing or maintaining bone density, stimulating osteoblast growth, or modulating osteoblast apoptosis. The present invention comprises administering preptin, a preptin analogue or agonist thereof, which corresponds to residues Asp-69 to Len-102 of the proinsulin-like growth factor II that is co-secreted with insulin from pancreatic islet beta cells in response to glucose. Accordingly, such compositions that exhibit osteopathic activities can be used to treat or

This invention Specifically, i

          The present invention describes a modified therapeutic peptide (I) CC comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidyl and maleimido groups) attached to CC a less therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a CC peptidase stabilised therapeutic peptides composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity in CC vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. CC Modifying and attaching therapeutic peptides to albumin prevents or CC reduces the action of peptidases of increase length of activity (half CC life) and specificity as bonding to large molecules decreases CC ABB90829 to ABB92441 represent peptides which can be used in the CC exemptification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                 The invention relates to polynucleotide and polypeptide sequences for a novel insulin homolog referred to as Zins3. The polynucleotide sequences encoding the Zins3 polypeptides are located on chromosome 12. The present invention also includes antibodies to the Zins3 polypeptides. The Zins3 polypucleotide and polypeptide sequences of the invention are useful for identifying and isolating receptors involved in growth and differentiation of Zins3 responsive cells. This sequence represents human insulin growth factor 2 (IGF2) that shows homology to human Zins3.

Protease-hydrolysed polypeptide #69

```
CC contacting the target substrate with a protease as cited in the use of contacting the target substrate with a protease as cited in the use of contacting the target substrate comprising administering to the patient content of a disease in a patient contected content of a protease with defined specificity for the specific target substrate. CC an protease hydrolyzes the target substrate and eliminates or reduces content of the protein and/or activates or content of the target protein and/or adds one or content of the target protein, and/or adds one or content of the target protein, and/or adds one or content of the target protein. The protease may be administered to treat immune disorders, inflammatory disorders, cancers, hematological diseases, cardiovascular diseases, metabolic disorder, cancers, hematological diseases, cardiovascular diseases, respiratory diseases, cardiovascular diseases, respiratory diseases, cardiovascular diseases, respiratory diseases, cardiovascular diseases, growth disorders, nutritional disorders and infections. This sequence represents a polypeptide hydrolysed by a cardiovascular diseases, cardiovascular diseases, cardiovascular diseases, cardiovascular diseases, respiratory diseases, cardiovascular diseases, cardiovascula
                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                              The sequence is human prepro-insulin-like growth factor-2. DNA probes prepared against DNA encoding the protein sequence may be to detect the presence of the genes in a natural source. The probes may be used to detect mutations and/or deletions in humans suffering from growth deficiencies. See also AAN60489, AAN60490 (Updated on 03-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present cDNA sequence is Insulin-like growth factor II. This was selected as the second protein due to its binding affinity for IGFBP 6. The Renilla luciferase cDNA was fused to IGFBP 6 cDNA (insulin-like growth factor binding protein 6) and humanised GFP (green fluorescent protein) cDNA was fused to IGF-II (insulin-like growth factor II) cDNA. Living cells were transfected with the fused cDNAs and the fusion proteins were expressed. This is used in determining molecule interaction within a living cell by detecting any fluorescence resulting from luminescence resonance energy transfer from the donor luciferase
                                                                                                                                                                                                                                  Human ovarian cancer marker OV58.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc patient is afflicted with ovarian cancer. The method involves comparing cheerenges of the marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where cc the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as cc possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing covarian cancer (e.g. patients having a familial history of ovarian cancer. The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or Parkinson's disease), brain cdisorders (e.g. cerebral oedema, hydrocephalus or brain herniations), inflammations (e.g. bacterial or viral meningitis or encephalitis), considered the control of

This is an example of a gene product that is differentially expressed in cancer cells relative to non-cancer cells, or between cancer cells of different malignant potential. Such genes, and their gene products, can be assayed in addition to tyrosine threonine kinase (TTK, see ABP54938), in methods of the invention for differential expression in a test cell. The invention is based on the finding that TTK is differentially expressed in various forms of cancer. Methods are provided for the identification of cancerous cells, especially breast cancer and colon cancer cells, by detection of expression levels of TTK, as well as diagnostic, prognostic and therapeutic methods based on differential expression. These methods can be used as the basis of rational therapy. Assays for identifying molecules that modulate the activity of these genes in cancers, as well as methods of inhibiting tumour growth by inhibiting the activity of TTK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Reducing growth of cancer cells comprises reducing Tyrosine Threonine Kinase (TTK) activity, useful in diagnosing and treating disorders with abnormal expression levels and activity of TTK, such as lung, colon,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            prostate and ovarian cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is 80 % identical to a table of sequences (see ACC50951 to ACC51059). ACC50951 to ACC51059 encode the human bladder cancer-associated proteins given in ABR48146 to ABR48242). Bladder cancer-associated sequences from the present invention have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancer-associated transcript in a cell from a patient. The method is useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer, such as hormones or antibodies. The nucleic acid molecules from the present invention may be used in various screening and diagnostic methods, and for gene therapy, vaccine and/or antisense/inhibition applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-JUL-2001; 2001US-0302814P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to targetted therapeutic comprising a therapeutic agent that is active in a manmalian lysosome, and a means for binding an extracellular domain of human cation-independent mannose-6-phosphate receptor in a mannose-6-phosphate independent manner. The invention is useful for treating metabolic diseases such as lysosomal storage disease, e.g. Gaucher's disease, pompe's disease, Hurler's syndrome, Niemann-pick's disease, mannosidosis, fucosidosis, Schindler's disease, mucolipidosis, cystinosis, Batten's disease, prosposin, or infantile neuronal ceroid lipofiscinosis. The invention is also useful in gene therapy. The present sequence is human insulin-like growth factor 2 (IGF-II). This sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chan
```

with an amount of an agent effective to reduce TTK polypeptide activity
CC in the cell), an assay for identifying a candidate agent that reduces
CC TTK polypeptide in the presence of a candidate agent; and (ii) comparing
CC the activity of TTK polypeptide in the presence of a candidate agent
CC relative to TTK polypeptide activity in the absence of the candidate
CC agent), identifying an agent that reduces
CC contacting a cancerous cell displaying elevated expression of a TTK.
CC contacting a cancerous cell displaying elevated expression of a TTK.
CC encoding polynucleotide with a candidate agent; and (ii) determining the
CC effect of the candidate agent on TTK polypeptide activity) and assessing
CC the prognosis of a cancerous disease other than ovarian cancer in a
CC level of expression of TTK-encoding polynucleotide in a test cancer cell of a subject; and (ii) comparing a
CC level of expression of TTK-encoding polynucleotide in the test cancer
CC cancer cell, where the level of expression of TTK in the test cancer cell of expression of TTK in the test cancer cell of cancer cell of expression of TTK in the test cancer cell cell ive to the level of expression in the control non-cancer cell is
CC indicative to the level of expression in the cancer cell is
CC indicative of the prognosis of the cancerous disease). The methods are
CC useful for detecting cancer (other than ovarian cancer) in a subject,
CC reduces growth of cancerous cells, identifying an agent that reduces TTK
CC of a subject to respond to a particular therapy e.g. as a basis of
CC ativity and assessing the prognosis of a cancerous disease other than
CC of a subject to respond to a particular therapy e.g. as a basis of
CC insulin-like growth factor)
CC (insulin-like growth factor) non-cancer cell, where an increase in the expression level of TTK protein or nucleic acid in the test cell compared to that in the normal cell, indicates the presence of cancer other than overian cancer. Also included are reducing growth of a cancerous cell (by contacting a cancerous cell (insulin-like growth factor) in

Sequence 180 A A

                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of detecting an ovarian cancer-
associated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polynucleotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
in diagnosing ovarian cancer and in identifying and using agents and/or
targets that inhibit ovarian cancer. The nucleic acid molecule,
polypeptide and the antibody may also be used in detecting ovarian
cancers, monitoring and early detection of relapse following treatment,
monitoring response to therapy, selecting patients for post-operative
chemotherapy or radiation therapy, in selecting mode of therapy,
and as vaccines. This sequence corresponds to one of the proteins used
for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient polynuclectide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            18-JUN-2001; 2001US-0299234P.

     Pred. No. is the number of results predicted by chance to has
score greater than or equal to the score of the result being
and is derived by analysis of the total score distribution.
  seq length: 0 seq length: 2000000000

Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.

If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession
